ABSTRACT:

The assembly to deliver an aroma to enclosed spaces has a number of supply containers (12, 14) for materials with different smells, in a pref. exchangeable supply container unit (10). Each container (12. 14) has a feed system (16, 18) to deliver a selected aromatic from it to at least one delivery (20, 22) point into the space. A dosing unit (24, 30) serves each container.
